## Abstracts

The global Perovskite Coating Equipment market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Perovskite coating equipment refers to the machinery or equipment used for applying a coating of calcium titanium oxide onto the surface of a material. This coating process involves depositing a thin layer of calcium titanium oxide onto the substrate material to enhance its properties or provide specific functionalities. The equipment typically includes a deposition chamber, where the coating process takes place, and various components such as a vacuum system, heating elements, and a source of calcium titanium oxide material. The substrate material is placed inside the deposition chamber, and the coating material is vaporized or ionized and then deposited onto the substrate surface through methods like physical vapor deposition (PVD) or chemical vapor deposition (CVD).

The purpose of using calcium titanium oxide coating equipment is to modify the surface characteristics of the substrate material, such as improving its corrosion resistance, wear resistance, or optical properties. This coating process finds applications in various industries, including electronics, optics, aerospace, and automotive, where enhanced material properties are desired for specific applications or functionalities.
