Abstracts

The global Persimmon Vinegar market size is expected to reach \$ 598 million by 2032, rising at a market growth of 4.5% CAGR during the forecast period (2026-2032).

Persimmon vinegar is a fruit vinegar product made from ripe persimmons through processes such as washing, crushing, saccharification, alcoholic fermentation, and acetic acid fermentation. It has an amber appearance, a persimmon aroma, and a mellow, acidic taste. Persimmon vinegar is rich in organic acids (such as acetic acid, citric acid, malic acid, and succinic acid), amino acids, vitamin C, minerals, polyphenols, and flavonoid antioxidants. It is low in calories (approximately 20-30 kcal/100g) and contains dietary fiber and potassium. These components give persimmon vinegar certain health benefits.

Traditional brewing emphasizes natural fermentation and time aging. One typical method is 'jar brewing,' where earthenware jars are placed in temperature- and humidity-controlled caves or cellars, with a fermentation period of 1-3 years, resulting in a mellow-tasting vinegar. Another unique traditional method is to seal and age high-quality 'first-pressed vinegar' for several years as a precious gift, its flavor becoming increasingly complex over time.

Modern processes focus on standardized and large-scale production, ensuring stable product quality through the introduction of scientific methods. Its characteristics include: using selected specific yeasts and acetic acid bacteria to control flavor during brewing; shortening the fermentation cycle and improving raw material conversion rate through temperature control and enzymatic hydrolysis technologies; and finally ensuring product hygiene, safety, and a longer shelf life through fine filtration, sterilization, and aseptic bottling.

In 2025, global persimmon vinegar sales reached 108 million liters, with a production capacity of approximately 138 million liters, an average selling price of US\$3.94 per liter, and an average gross profit margin of 42.3%.
