Abstracts

The global Personalized Therapy Biosimulation Platform market size is expected to reach \$ 3583.9 million by 2029, rising at a market growth of 14.0% CAGR during the forecast period (2023-2029).

Increasing prevalence of malignancies and cancers, rising demand for biologics and biopharmaceuticals, high failure rate of clinical trials and high incidence of drug resistance are the key factors driving the growth of biomimetic personalized therapy market revenue.

Personalized Therapy Biosimulation refers to biosimulating a patient's unique cancer response to therapy prior to treatment and identifying new drug combinations for refractory patients. By utilizing this technology to determine a patient's Therapeutic Response Index, or TRI. TRIs in treatment-naive patients determine whether a patient will respond to standard-of-care treatments. For relapsed or refractory patients, TRIs identify the ideal combination of FDA-approved drugs that patients will respond to.
