Abstracts

The global PES Microporous Membrane Folding Filter Cartridge market size is expected to reach \$ 709 million by 2032, rising at a market growth of 5.3% CAGR during the forecast period (2026-2032).

PES Microporous Membrane Folding Filter Cartridges are precision filter elements formed by folding a PES microporous membrane as the core filtration medium and then thermally welding it with a support layer, flow guide layer, central rod, outer shell, end caps, and seals. They are primarily used to retain particulate matter, microorganisms, and colloidal impurities in liquids. Their characteristics include good hydrophilicity, high flux, low protein adsorption, and low leaching, making them suitable for filtration applications with high cleanliness requirements, such as biopharmaceuticals, food and beverage, electronic ultrapure water, and high-purity chemicals.

Upstream components mainly include PES resin, membrane solvents, pore-forming agents, hydrophilic modification materials, PP supports and structural components, sealing materials, and cleanroom packaging materials. PES resin determines the membrane's heat resistance, mechanical strength, and chemical stability; the membrane solvent and pore-forming system affect pore size distribution, flux, and retention consistency; hydrophilic modification materials improve wettability, reduce protein adsorption, and increase initial flow rate; PP nonwoven fabric, flow guide layer, center rod, shell, and end caps determine the filter element's pressure resistance, folding stability, and welding reliability; and sealing rings such as silicone, EPDM, and FKM determine compatibility with pharmaceutical, beverage, chemical, or ultrapure water systems.

Global sales are projected at approximately 4.6 million units in 2025, with a global

average price of approximately US\$105 per unit and a gross profit margin of approximately 35%-50%.

The growth of polyethersulfone (PES) microporous membrane pleated filter cartridges is primarily driven by increased demand for aseptic filtration in biopharmaceuticals, disposable process systems, microbial control in food and beverage, and filtration of ultrapure water for semiconductors and chemicals in electronics. Compared to PP filter cartridges, PES filter cartridges offer advantages in high throughput, low protein adsorption, and low dissolution, making them more suitable for high-value liquids and applications requiring high cleanliness. Industry obstacles include high barriers to entry in high-performance PES membrane materials, pore size consistency, integrity testing, clean manufacturing, and customer validation, as well as long adoption cycles for pharmaceutical and electronics customers. The future market will likely move towards low dissolution, low adsorption, high throughput, integrity testing, sterilization compatibility, and domestic substitution. Price competition for general industrial-grade products will intensify, while pharmaceutical-grade, electronic-grade, and high-purity liquid filtration products will continue to offer good profit margins.
