Abstracts

The global Pet Carpal Orthosis market size is expected to reach \$ 18.74 million by 2032, rising at a market growth of 14.6% CAGR during the forecast period (2026-2032).

In 2025, the global production of pet carpal orthosis is estimated at 35,000 units, with an average selling price of about US\$200 per unit, a gross profit margin of about 50%, and a single production line capacity of about 600 units per year. A pet carpal orthosis is a medical device, customized or adjustable to fit the individual animal's needs, used for external fixation, support, and restriction of wrist joint movement. Its core purpose is to manage and treat wrist joint structural and functional abnormalities caused by injury, disease, or congenital defects by providing external stability, thereby relieving pain, promoting healing, and improving mobility. The upstream of pet wrist orthotics involves suppliers of raw materials and components such as high-performance polymers (e.g., carbon fiber, medical-grade thermoplastics), metal fittings, flexible foam, and hook and loop fasteners. The midstream involves the core links of 3D scanning, computer-aided design, and manufacturing, with professional orthotics companies performing digital design, processing customization, and assembly. Downstream demand comes directly from pet owners, with veterinarians prescribing treatments based on clinical diagnoses such as hyperextension of the wrist joint, ligament tears, arthritis, and post-fracture surgery in dogs and cats. The core driving factors for this demand are the increasing emphasis in modern veterinary medicine on non-invasive treatment and post-operative rehabilitation quality, as well as pet owners' continued investment in improving the quality of life and welfare of their companion animals.

The growth of the global pet carpal orthosis market is driven by three core factors: First, the trend towards anthropomorphism in pets and the upgrading of medical needs. As pets play an increasingly important role in the family, pet owners' willingness and ability

to pay for treatment of sick or injured pets have significantly increased. The treatment model has expanded from basic care to a full-cycle service of 'prevention-treatment-rehabilitation,' creating clear clinical demand for orthotics and other rehabilitation medical devices. Second, the aging of pets and the increase in sports injuries. The increased average lifespan of pets has led to a rise in the incidence of degenerative diseases such as osteoarthritis. At the same time, sports injuries are frequent in active dog breeds, making conditions such as wrist instability require external orthotics for non-surgical or post-operative fixation support. Finally, industry policy support and breakthroughs in personalized manufacturing technology. Local governments encourage companies to provide personalized customization services for pet prostheses, orthotics, and other products, supporting the application of advanced technologies in the pet medical device field. Meanwhile, the maturity of 3D printing and digital design technologies has made low-cost, precisely matched customized orthotics possible, promoting the clinical adoption of these products.
