Abstracts

The global Pet Chip Implant market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A pet chip implant, also known as a microchip implant, is a small electronic device that is implanted under the skin of a pet, typically dogs or cats. This microchip contains a unique identification number that can be used to identify and reunite lost or missing pets with their owners. It serves as a permanent form of identification and is a widely used method for keeping track of pets. Pet chip implants are typically about the size of a grain of rice and are inserted just beneath the skin between the shoulder blades of the pet. This procedure is relatively quick and minimally invasive, similar to a vaccination.

The microchip contains a unique identification number, typically a series of 15 digits, which can be read using a microchip scanner. The pet owner's contact information, including name, address, and phone number, is associated with the microchip's identification number in a pet registry. This allows for easy identification and contact in case the pet is lost or found. Unlike collars or tags, which can be lost or removed, a microchip provides permanent identification that cannot be easily tampered with or lost.

This report studies the global Pet Chip Implant production, demand, key manufacturers, and key regions.
