## Abstracts

According to our (Global Info Research) latest study, the global PET Optical Base Film market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

PET optical base film is one or more layers of film coated on the surface of optical parts in order to change the surface of traditional optical parts through optical technology characteristics. The property is a smooth surface with a geometrically separated interface between the thin film layers. The refractive index of the thin film layer has a transition at the interface, but it is continuous within the thin film layer, and it is a transparent medium. It can also be an absorption medium, which can be Ordinary uniform or ordinary inhomogeneous. Practical applications of thin films are much more complicated than ideal thin films. This is because the optical and physical properties of the film are different from those of the bulk material. The surface and interface of the film are rough, which leads to the diffusion and scattering of the beam. Due to the growth, structure and stress of the film, the anisotropy of the film is formed, and the film has complex time effects.
