The global Phakic Intraocular Lens (PIOL) market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Phakic Intraocular Lens is made of a highly purified biosilica gel with good biocompatibility. Under a microscope, an intraocular lens with a degree is implanted in the posterior chamber of the patient's eye (behind the iris and in front of the natural lens) to achieve the purpose of correcting myopia. This surgery replaces spectacles or hospital spectacles and improves the uncorrected vision of patients. It has the same leading position as the new generation of excimer laser surgery in correcting vision with refractive surgery, so that patients with high myopia can get safe and effective vision correction.
