## Abstracts

The global Pharmaceutical Asset Performance Management (APM) market size is expected to reach \$ 192 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

Pharmaceutical Asset Performance Management (APM) refers to the use of data-driven methods to monitor, analyze, and optimize the entire lifecycle of key assets in pharmaceutical companies across R&D, production, quality, supply chain, and equipment. This aims to improve asset reliability, reduce operational risks, enhance compliance, and ultimately maximize the overall efficiency and value of drugs from R&D to market launch. Here, 'assets' include not only physical assets such as equipment and facilities, but also 'digital assets' and 'knowledge assets' such as R&D pipelines, process parameters, quality data, and supply chain nodes.

Pharmaceutical asset performance management (APM) is undergoing a leap from 'digitalization at the equipment level' to 'intelligentization across the entire value chain,' and the industry is changing faster than many people imagine. In the past, the core selling point of APM was reducing downtime and improving OEE (Outcome Effectiveness). However, pharmaceutical companies now place greater emphasis on process predictability, quality consistency, and automated compliance. This has led APM to gradually penetrate from the OT (Operational Technology) domain into the IT (Data), QT (Quality Technology), and PT (Process Technology) domains. A clear trend is that companies are beginning to treat APM as the infrastructure for 'Continuous Validation (CPV)' and 'data integrity,' rather than a standalone tool. This means that the boundaries of APM are expanding; it is no longer just about monitoring equipment, but about understanding the root causes of batch behavior, process drift, and quality

deviations. With the increasing acceptance of AI/ML in the pharmaceutical industry (especially with the FDA's increasingly clear stance on model management), APM is moving from 'post-event analysis' to 'pre-event warning,' and from 'experience-driven' to 'model-driven.' In the next three to five years, the competitive focus of APM will shift from 'who can access more equipment data' to 'who can transform data into auditable, interpretable, and regulatory insights.' In particular, the value of APM will be further amplified in complex process scenarios such as continuous manufacturing, cell gene therapy (CGT), and high-activity drugs (HPAPI).
