According to our (Global Info Research) latest study, the global Pharmaceutical Filtration market size was valued at USD 15990 million in 2023 and is forecast to a readjusted size of USD 23640 million by 2030 with a CAGR of 5.7% during review period.

Filtration is a method used to separate or collect a desired solid from a solution or to remove solid impurities from a liquid. Pharmaceutical filtration refers to the process of eliminating unwanted particles such as undissolved powders and solid impurities from the processed components, raw material, air, and water leading to a reduction in bacteria. The filters prevent the processed solution from contamination and help to maintain sterility.

Based on technique, the microfiltration segment dominated this market in 2017. The technique is applied to various applications ranging from the removal of unwanted suspensions to the removal of bacteria from the process material. This is the major factor responsible for the large share of this segment.
