Abstracts

According to our (Global Info Research) latest study, the global Pharmaceutical Industry Granulator market size was valued at US\$ 306 million in 2025 and is forecast to a readjusted size of US\$ 369 million by 2032 with a CAGR of 2.8% during review period.

Pharmaceutical Industry Granulator is a specialized machine used to convert fine powder particles into uniform, larger granules through a process known as granulation. This process is essential in pharmaceutical manufacturing, particularly for the production of solid dosage forms such as tablets and capsules. Granulators improve powder flowability, compressibility, and uniformity of active pharmaceutical ingredients (APIs), thereby enhancing the consistency, bioavailability, and quality control of the final product. These machines typically operate using either wet granulation (adding a liquid binder) or dry granulation (compaction without liquid).

The global market for Pharmaceutical Industry Granulator is witnessing consistent growth, driven by rising demand for solid oral dosage forms, especially tablets and capsules, which remain the most preferred delivery method worldwide. Factors such as the growing prevalence of chronic diseases, aging population, expanding generic drug manufacturing, and technological innovation in granulation systems are contributing to the market expansion. High-shear and fluid bed granulators dominate the market due to their ability to produce consistent granule size with higher process efficiency and scalability. Moreover, the push for continuous manufacturing and automation is prompting pharmaceutical companies to upgrade older batch granulation systems to modern, automated granulators with real-time monitoring capabilities.
