Phase array transducers are a type of ultrasound transducer used in medical imaging that employs an array of multiple small elements (or crystals) arranged in a specific pattern. By electronically controlling the timing (or phase) of the signals sent to each element, these transducers can steer and focus the ultrasound beam in different directions without physically moving the transducer. This capability allows for real-time imaging of structures from various angles, making them highly effective for dynamic imaging in procedures such as cardiac and musculoskeletal ultrasound. Phase array transducers provide improved image quality, resolution, and flexibility in obtaining diagnostic images from different depths and orientations.
