Abstracts

The global PHEV Intake Manifold market size is expected to reach \$ 197 million by 2032, rising at a market growth of 6.8% CAGR during the forecast period (2026-2032).

A PHEV intake manifold is the core air-distribution component of a plug-in hybrid's ICE intake path, routing (naturally aspirated or boosted) air from the throttle/charger outlet to each cylinder runner to achieve uniform filling, swirl/tumble management, and NVH targets. Modern designs often integrate sensor ports (MAP/IAT), PCV/EGR passages, variable intake actuators/flaps, and—on turbo engines—may be packaged as an integrated intake/charge-air module. Material choices typically include glass-fiber reinforced polyamides and aluminum, with higher-temperature duty pushing toward PPA/PPS-class polymers.

The upstream segment consists of resins and modified materials and seals/fasteners; the midstream segment comprises Tier-1 air management/intake system suppliers; and the downstream segment consists of vehicle manufacturers and engine platforms.

In 2025, global PHEV intake manifold production reached approximately 6 million units, with an average global market price is between \$15 and \$20 per unit.

This report studies the global PHEV Intake Manifold production, demand, key manufacturers, and key regions.
