PHIL testbed (Power Hardware-in-the-Loop Testbed) is a comprehensive test platform that integrates real-time simulation technology and Hardware-in-the-Loop (HIL) technology. It is mainly used for real-time simulation testing of power systems. By connecting actual power hardware equipment with a real-time simulator, the interaction between the hardware and the simulation environment is realized. In the PHIL test bench, the real-time simulator simulates the dynamic behavior of the power system, while the actual power hardware equipment is connected to the simulation environment as the object under test (DUT, Device Under Test), and its performance is verified through interaction with the actual power grid. and behavior.

With the acceleration of global energy transformation and smart grid construction, the demand for real-time simulation testing of power systems continues to increase. As an important tool for power system testing, the market demand for PHIL test benches continues to grow. Especially in the fields of power electronics, new energy access, microgrids and other fields, PHIL test benches are increasingly used. The continuous advancement of key technologies such as real-time simulation technology, power amplification technology, and interface technology has provided strong support for the

performance improvement and application expansion of PHIL test benches. At the same time, some new testing methods and technologies, such as virtual synchronization machine technology, modular design technology, etc., have also brought new opportunities to the development of the PHIL test bench market.
