## Abstracts

Phosphor plate imaging is the fastest-growing segment of the dental imaging market. Phosphor plates, also known as PSPs, have several advantages and some disadvantages when compared to dental sensor imaging. On the plus side, the handling and positioning of PSP plates is virtually identical to film, and thus an easy transition for a practice switching from traditional X-ray film. Like film, PSPs are flexible and can be well-tolerated in the posterior regions of the mouth—unlike rigid and bulky sensors. A disadvantage of PSP plates is that they require “processing,” while with sensors, the image is available virtually instantaneously. For those dentists who have either chosen phosphor plate imaging or are considering this technology, the handling of these plates is critical to prolonging plate life and achieving consistently well-processed images.

According to our (Global Info Research) latest study, the global Phosphor Dental Plate market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
