A Photo Interrupter Sensor is an electronic device that detects the presence or absence of an object by using a light source and a photodetector. It consists of a light-emitting diode (LED) on one side and a phototransistor or photodiode on the other side. When an object interrupts the beam of light between the LED and the photodetector, the sensor detects the change in light intensity and sends a signal to the microcontroller or control circuit. Photo interrupter sensors are commonly used in applications such as printer paper detection, counting devices, and robotics for object detection and position sensing.
