Abstracts

The global Photo-Radical Polymerization Initiators market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Photo-radical polymerization initiators are compounds that, upon exposure to light (typically ultraviolet or visible light), generate free radicals which initiate the polymerization process of monomers. These initiators are used in photo-initiated polymerization reactions to create polymers with desired properties such as molecular weight, crosslinking density, and functionality. They play a crucial role in various applications including coatings, adhesives, 3D printing, and electronics manufacturing, where precise control over polymerization is required. Examples of photo-radical polymerization initiators include benzoin derivatives, benzophenone derivatives, and camphorquinone.
