Abstracts

The global Photocatalyst Filter Screen market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The photocatalyst filter is made by doping nano-scale powder with various nano-scale light-sensitive semiconductor media to ensure sufficient ventilation and contact, and then mixed with the carrier to effectively remove carbon monoxide in the air, nitrogen oxides, hydrocarbons, aldehydes, benzene and other harmful gases and odors, and can decompose them into harmless CO₂ and H₂O, and also has a bactericidal function. The photocatalyst filter is made of nano-titanium dioxide photocatalyst, combined with advanced technology to make the photocatalyst evenly adhere to the surface of different materials with very small particles. Transition to the conduction band, generate corresponding holes (h⁺) on the valence band, generate active oxygen and hydroxyl radicals with strong oxidation, and remove harmful organic substances such as formaldehyde, methylamine, benzene, xylene, TVOC, and pollution. Oxidation and decomposition of pollutants, odors, bacteria, etc. into harmless CO₂ and H₂O, to achieve the purpose of purifying the air and decomposing harmful organic substances.
