Abstracts

The global Photochemical Etchants market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Photochemical etching, also called Metal etching, refers to the removal of the protective film of the metal etching area after exposure. Through contact with chemical solutions, the surface of a metal plate will be dissolved and form hollowed out areas. It was first used in the manufacturing of copper plate, zinc plate, and other concave and convex printing plates. It was widely used to reduce the weight of instrument panels, and for the processing of thin workpieces such as nameplates. Through continuous improvements in the technology of process equipment, etching technology has now been developed for use in the aviation, machinery, and chemical industry, as well as for use in semiconductor manufacturing processes, and the processing of precision metal etching products and thin electronic parts.

This report studies the global Photochemical Etchants production, demand, key manufacturers, and key regions.
