The global Photochromic Anti-radiation Glasses market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Photochromic anti-radiation glasses are eyeglasses that combine the features of photochromic lenses and anti-radiation coatings. They are designed to protect the eyes from harmful UV radiation, as well as from the blue light emitted by digital screens and other sources. These glasses are made with special lens coatings that block out UV radiation and blue light. The photochromic molecules in the lens material also darken in response to UV radiation, providing additional protection when the glasses are exposed to sunlight.
