Abstracts

Photochromic polycarbonate lenses are a special type of eyeglass lenses that are photosensitive, meaning they change color when exposed to ultraviolet rays or sunlight. This kind of lens is usually made of polycarbonate material, which is lightweight, impact-resistant and highly transparent. It is a high-quality eyeglass lens material.

Photochromic polycarbonate lenses work by using special photosensitive dyes or additives that react chemically when exposed to ultraviolet light, causing the lens to change color. Generally speaking, when the lens is exposed to the sun, it will darken to reduce the stimulation of the eyes by strong light; when the lens is away from ultraviolet rays, the color will gradually return to its original state.

According to our (Global Info Research) latest study, the global Photochromic Polycarbonate Lens market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
