Abstracts

Photocoagulator is a type of semi-automatic pattern scan laser photocoagulation system designed to treat ocular diseases with the help of a single shot or predetermined pattern array. The device is for ophthalmologists, chiefly those that focus in vitreo-retinal surgery, which is an eye surgery. Photocoagulation is not used for tumours that involve the optic disc or fovea, as this technique would result in loss of central vision. In such cases, external beam radiation or chemoreduction are typically used.

This report studies the global Photocoagulator Devices production, demand, key manufacturers, and key regions.
