Abstracts

Photogrammetry is a form of 3D scanning that involves capturing photographs of an area of interest and recreating it as a digital 3D asset. This includes capturing of photos and the processing algorithms required to generate structure from motion data, depth maps, geometry meshes, and texture data. The result is a 3D mesh and texture map serialized in a common format readable by popular digital content creation (DCC) tools and 3D rendering engines. Examples of photogrammetry applications include film visual effects, animation, video games, augmented reality (AR) or virtual reality (VR) applications, and geospatial land surveying.
