According to our (Global Info Research) latest study, the global Photoluminescence Scanner market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A 'Photoluminescence Scanner' is a device designed to detect and measure photoluminescence emitted by materials when exposed to light. Photoluminescence is the emission of light by a substance after it absorbs photons from an external light source. In the context of a scanner, the device typically includes a light source that illuminates the material being scanned, causing it to emit photoluminescent light. The scanner then captures and analyzes the emitted light using sensors or detectors, providing information about the material's photoluminescent properties.
