Abstracts

The optical chip is used to convert photoelectric signals. It is equivalent to an information-transfer station. The working principle is to integrate the light which emitting from indium phosphide and the optical routing capability of silicon into a single chip. The light beam get generated when a voltage is applied to indium phosphide, thus could drive other silicon photonic devices to operate. The light chip uses semiconductor light-emitting technology, and the light-emitting phenomenon belongs to direct light emission in the semiconductor.
