## Abstracts

The global Photon-counting Computed Tomography market size is expected to reach \$ 1100.5 million by 2029, rising at a market growth of 46.1% CAGR during the forecast period (2023-2029).

Global key players of photon-counting computed tomography include Siemens Healthineers and NeuroLogica, which have a share about 100%. Europe is the largest sales market, which has a share about 50%, followed by North America, with share about 27%. In terms of product, CZT is the largest segment, with a share about 88%.

Photon-counting Computed Tomography (PCCT) is an emerging technology in CT imaging, which could represent the next major technological milestone in the field. Briefly, PCCT uses energy-resolving detectors, thereby enabling scanning at multiple energies. Photon-counting CT is an emerging technology with the potential to dramatically change clinical CT. Photon-counting CT uses new energy-resolving x-ray detectors, with mechanisms that differ substantially from those of conventional energy-integrating detectors. Photon-counting CT detectors count the number of incoming photons and measure photon energy. This technique results in higher contrast-to-noise ratio, improved spatial resolution, and optimized spectral imaging. Photon-counting CT can reduce radiation exposure, reconstruct images at a higher resolution, correct beam-hardening artifacts, optimize the use of contrast agents, and create opportunities for quantitative imaging relative to current CT technology.
