Abstracts

According to our (Global Info Research) latest study, the global Photoresist Ancillary Materials market size was valued at US\$ 2423 million in 2025 and is forecast to a readjusted size of US\$ 3985 million by 2032 with a CAGR of 7.1% during review period.

Photoresist Ancillary Materials are high-purity electronic process materials used directly with photoresists in semiconductor lithography. They support surface preparation, resist coating, edge bead removal, development, rinsing, stripping, residue removal, reflectivity control, interface management and multilayer pattern transfer on wafers and advanced packaging substrates. The product scope includes developers, photoresist thinners, edge bead removers, rinse and pre-wet solutions, photoresist strippers and removers, HMDS adhesion promoters, BARC, TARC, topcoat, SOC, SiARC and other ancillary materials directly tied to the photoresist process window. Key performance requirements include metal ion control, particle control, residue control, coating uniformity, volatility control, material compatibility, low defectivity and batch-to-batch consistency.

Photoresist Ancillary Materials represent a critical process-material category positioned between photoresists and wet electronic chemicals. Their value is not defined purely by consumption volume, but by their impact on lithography process windows, defectivity, pattern fidelity, edge cleanliness, residue removal and compatibility with downstream etch, plating and packaging processes. Under the narrow scope used in this report, the market excludes photoresists, PAGs, resins, generic solvents and display/PCB-only materials, and focuses on developers, strippers, thinners, edge bead removers, rinse solutions, HMDS, BARC, topcoat, SOC and SiARC used directly with photoresists in semiconductor wafer fabrication and advanced packaging.

From a supply perspective, high-end Photoresist Ancillary Materials remain led by Japanese, U.S. and European suppliers. TOK, FUJIFILM, Qnity, JSR, Merck, Brewer Science, Nissan Chemical and Kanto Chemical have strong positions due to long-term customer qualification, broad product portfolios and deep process know-how. South Korean and Taiwanese suppliers are more regionally tied to memory, display, foundry and packaging supply chains, while Chinese suppliers are accelerating localization in developers, strippers, EBR, HMDS, SOC and BARC. However, Chinese suppliers still vary significantly in product grade, batch stability, customer qualification and advanced-node compatibility.

Demand growth is driven by both wafer fabrication and advanced packaging. Wafer fabs remain the largest demand base, supported by logic foundry, DRAM, 3D NAND, power devices, sensors and mature-node ICs. Advanced packaging is becoming a higher-growth segment, as RDL, bumping, TSV, fan-out, 2.5D/3D packaging and glass substrate processes require thick-resist development, high-selectivity stripping, low-corrosion cleaning and large-area uniformity. Compared with front-end advanced lithography, advanced packaging has lower resolution requirements but higher sensitivity to thick-film removal, metal compatibility, cost and panel-level yield.
