Abstracts

According to our (Global Info Research) latest study, the global Photoresist Initiator (PI) market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The photoresist initiator is a key component in photoresist, which plays a role in triggering photochemical reactions during the photolithography process. The photoresist initiator can absorb the light emitted by the photolithography machine, and trigger the chemical reaction in the photoresist through the electrons or excited molecules generated by the light excitation, thereby realizing the transfer of the pattern and the definition of the pattern.

The choice of photoresist initiators depends on factors such as the type of photoresist being used, the wavelength of the light source, and the desired chemical reaction. They play a vital role in the photolithography process, enabling high-resolution, high-precision pattern definition and transfer.
