## Abstracts

The global Photosensitive Polymer Material market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Photosensitive polymer material, also known as photopolymer or light-activated resin, is a type of material that changes its physical or chemical properties when exposed to light, often in the ultraviolet or visible region of the electromagnetic spectrum. These changes can be manifested structurally, such as hardening, cross-linking, or patterning of the material, or chemically, such as color change, degradation, or polymerization of the material. Photosensitive polymer material is widely used in various applications, such as 3D printing, photoresists, coatings, adhesives, medical devices, and optical devices.
