According to our (Global Info Research) latest study, the global Photostimulable Phosphor (PSP) Systems market size was valued at USD 78 million in 2023 and is forecast to a readjusted size of USD 102.4 million by 2030 with a CAGR of 3.9% during review period.

Intraoral phosphor plate x-ray (also known as phosphor storage plate or PSP x-ray) eliminates the need for traditional film processing for dental radiography. Phosphor storage plates can convert existing film based imaging systems to a digital format that can be integrated into a computer or network system.

As more and more medical and dental applications use digital radiography systems, the market for phosphor storage plate systems is expanding. PSP systems provide faster processing times, improved image quality, and electronic image storage and retrieval. Additionally, the elimination of hazardous waste generated by traditional film radiography systems and other environmental advantages of these systems are encouraging their adoption. Technological breakthroughs, including improvements in PSP sensitivity and resolution and the creation of new PSP materials and coatings, are also driving the market.
