A photothermal coating thickness measurement system is a technical device that uses the principle of photothermal to measure the thickness of coatings on the surface of an object. This system usually uses a laser or other light source to illuminate the surface of the coating. The coating absorbs light and converts it into heat energy, resulting in temperature changes in the coating and the underlying material. By accurately measuring the temperature change and combining the thermophysical properties of the material, the thickness of the coating can be calculated.
