## Abstracts

The global Photovoltaic EVA Films market size is expected to reach \$ 5308 million by 2032, rising at a market growth of 6.1% CAGR during the forecast period (2026-2032).

Photovoltaic EVA Film is an encapsulation film made mainly from ethylene-vinyl acetate copolymer and used in solar PV modules between the front glass, solar cells, and backsheet or rear glass. During lamination, it bonds and protects the cells, providing optical transparency, adhesion, cushioning, electrical insulation, moisture resistance, and weather durability, thereby helping maintain the power output and long-term reliability of photovoltaic modules in outdoor environments. The price of Photovoltaic EVA Film remains relatively low, with transparent EVA film at around RMB 7.23/m<sup>2</sup> and white EVA film at around RMB 7.73/m<sup>2</sup>, roughly equivalent to about US\$1/m<sup>2</sup>; annual global EVA film output/sales can be estimated at roughly 3.3–3.6 billion m<sup>2</sup>, with Chinese suppliers remaining the dominant producers.

The upstream of the Photovoltaic EVA Film industry mainly includes EVA resin, crosslinking agents, antioxidants, UV absorbers, tackifying resins, additive masterbatches, release films, and packaging materials, among which EVA resin is the key raw material affecting cost, transparency, crosslinking performance, and aging resistance. The midstream consists of photovoltaic encapsulation film manufacturers, which convert raw materials into transparent EVA film, white EVA film, anti-PID film, high-transparency film, and other products through formulation design, melt extrusion, casting, online inspection, winding, and slitting. The downstream market is mainly photovoltaic module manufacturers, where EVA film is used for encapsulating crystalline silicon modules, glass-backsheet modules, glass-glass modules, and some high-efficiency cell modules, with demand closely linked to global PV installations, module output, cell technology trends, and long-term reliability requirements.

The market for Photovoltaic EVA Film remains a fundamental and mainstream segment within PV encapsulation materials, with demand closely linked to solar module production and module structure upgrades. As N-type cells, glass-glass modules, and high-reliability modules continue to expand, competition is shifting from basic capacity and cost control toward integrated encapsulation performance, including high light transmittance, PID resistance, damp-heat durability, low degradation, and compatibility with POE and EPE structures; at the same time, under module price pressure and supply-chain cost reduction, EVA film suppliers need to rely on formulation optimization, production efficiency, and customer qualification capability to sustain competitiveness. InfoLink has also noted that encapsulation structures for TOPCon glass-glass modules are evolving toward more cost-efficient combinations, supporting a renewed increase in EVA usage.
