Abstracts

The global Photovoltaic Grid-Connected Inverter Testing market size is expected to reach \$ 194 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032).

Photovoltaic grid-connected inverter testing refers to third-party verification activities that validate inverter safety, grid-interconnection performance, power-quality behavior, protection functions, and interoperability. In practice, it bundles type testing, grid-code compliance checks, safety evaluation (e.g., IEC 62109 series), and region-specific certification pathways—such as requirements aligned with IEEE 1547 for DER interconnection and, in North America, UL 1741-based certification—resulting in test reports and certificates that enable market access. The price of photovoltaic grid-connected inverter testing typically ranges from about US\$10,000 to US\$30,000 per test, depending on the test scope, the number of applicable grid codes, and whether safety, EMC, and re-testing are included.

Growth is fueled by expanding global PV deployment and inverter shipments, which increases the cadence of new platform launches, firmware revisions, and regional market-entry programs (e.g., 2024 global shipments around 589 GWac). At the same time, grids increasingly expect DERs to provide more advanced behaviors, pushing testing toward deeper functional and interoperability verification. Finally, the coexistence of multiple standards and certification pathways (IEC safety plus IEEE/UL-related interconnection certification in certain regions) encourages manufacturers to rely on scaled third-party labs to shorten time-to-market, sustaining demand for testing services.
