Abstracts

Physical inorganic UV filters, also known simply as inorganic UV filters or mineral UV filters, are substances used in skincare products to protect the skin from the harmful effects of ultraviolet (UV) radiation emitted by the sun. These filters operate by reflecting and scattering UV rays away from the skin's surface, rather than absorbing them like chemical UV filters. Comprising minerals such as zinc oxide or titanium dioxide, physical inorganic UV filters create a protective barrier on the skin that effectively deflects UV radiation. When applied, these minerals form a layer that acts as a shield, preventing UV rays from penetrating the skin and causing damage. Physical inorganic UV filters are often favored by individuals with sensitive skin or those prone to allergic reactions, as they are less likely to cause irritation. Moreover, they provide broad-spectrum protection against both UVA and UVB rays.

According to our (Global Info Research) latest study, the global Physical Inorganic UV Filter market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
