Abstracts

According to our (Global Info Research) latest study, the global Pichia Pastoris market size was valued at US\$ 99 million in 2025 and is forecast to a readjusted size of US\$ 170 million by 2032 with a CAGR of 7.8% during review period.

Pichia pastoris (also known as Komagataella phaffii) refers to products in which this yeast serves as the core deliverable, including expression host strains, competent cells, expression system components, transformation kits, and customized engineered strains. The estimated overall gross margin is approximately 66%.

Products related to Pichia pastoris belong to a niche segment within protein expression hosts and engineered microbial strains. While the market size is not large, it maintains stable demand for research and development, pre-scale-up validation, and industrial enzyme expression screening.

Demand is primarily driven by industrial enzymes, diagnostic antigens, research-grade recombinant proteins, and biomanufacturing process development. Pichia pastoris offers eukaryotic expression capability, high-density fermentation potential, and relatively low production cost, making it valuable for secretion expression, extracellular enzyme production, and certain glycoprotein development. With the rise of precision fermentation, alternative proteins, and bio-based chemical projects, companies increasingly compare E. coli, Saccharomyces cerevisiae, Pichia pastoris, and filamentous fungi in early-stage screening, driving procurement of standard hosts, engineered strains, and supporting vector systems.

The market's growth ceiling is constrained by three factors: first, therapeutic protein commercialization remains dominated by mammalian platforms such as CHO cells,

leaving *Pichia pastoris* mostly in R&D, pilot, and some industrial enzyme applications; second, *E. coli* retains cost and operational advantages in low-cost, rapid-expression projects; third, traditional methanol-induction systems face scale-up safety, process control, and regulatory communication barriers. Future incremental growth is expected not from standard host strains but from glycoengineered strains, methanol-free induction systems, high-homology recombination platforms, and custom expression systems optimized for specific protein types.
