## Abstracts

The global Picket Fence Thickener market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Picket fence thickener is a type of gravity settler used in water or wastewater treatment systems. It is designed to separate solids from a liquid by allowing particles to settle and accumulate towards the bottom of the tank through the process of sedimentation.

The picket fence thickener consists of a series of vertical or inclined picket-shaped baffles arranged in a circular or rectangular tank. These baffles are evenly spaced and rise above the liquid level. The purpose of the baffles is to create compartments or channels that guide the flow of the liquid and direct the settling particles towards the bottom, allowing the clarified liquid to rise to the top.

As the liquid flows through the picket fence thickener, the particles or solids present in the liquid settle due to gravity and proximity to the baffles. The settled solids accumulate at the bottom of the tank as a sludge. The clarified liquid, with reduced solids content, overflows the weirs at the top of the tank and progresses to further treatment processes.

Picket fence thickeners are commonly used in water and wastewater treatment plants to achieve solid-liquid separation and provide efficient thickening of sludge. They are particularly suitable for applications where a high concentration of solids needs to be achieved in the thickened sludge, such as in sludge dewatering processes or treatment of industrial effluents.

By effectively separating solids from the liquid phase, picket fence thickeners help improve overall system performance, reduce process downtime, and achieve

environmental compliance.
