Abstracts

The global Piezoelectric Inertial Drive market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Piezoelectric inertia drives are space-saving and inexpensive piezoelectric drives with relatively high holding forces and an almost unlimited stroke range. They utilise the viscous slip effect (inertia effect) - the cyclical alternation of static and sliding friction between the runner and the drive element generated by the piezoelectric element - to achieve continuous feed of the runner. The operating frequency of more than 20 kHz enables the runner to be driven directly at speeds of more than 5 mm/s.

This report studies the global Piezoelectric Inertial Drive production, demand, key manufacturers, and key regions.
