Abstracts

The global Piezoelectric Injection Valve market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Piezoelectric ceramic injection valve is a valve that uses the Piezoelectricity of piezoelectric ceramic materials to control the injection flow. Piezoelectric ceramic materials have a piezoelectric effect, which means that under the action of an external electric field, size changes occur, thereby achieving mechanical motion. By utilizing this characteristic, the opening and closing degree of the piezoelectric ceramic injection valve can be controlled by controlling the size of the electric field, thereby controlling the injection flow rate. Piezoelectric ceramic injection valves have the advantages of fast response speed, high accuracy, and good reliability. In the injection system, precise control of injection flow can be achieved by changing the size of the electric field, thereby meeting the needs of different application scenarios. Piezoelectric ceramic injection valves are widely used in fields such as automotive fuel injection systems, medical devices, and inkjet printers. The working principle of piezoelectric ceramic injection valve is that when the voltage is applied, the piezoelectric ceramic material will produce Piezoelectricity, resulting in small changes in material size. By combining piezoelectric ceramic materials with the valve, when voltage is applied to the piezoelectric ceramic, the valve opens; When the voltage disappears, the valve closes. By controlling the voltage switch, the opening and closing control of the injection valve can be achieved, thereby controlling the injection flow rate. In a word, piezoelectric ceramic injection valve is a valve that uses the Piezoelectricity of piezoelectric ceramic materials to control the injection flow. It has the characteristics of rapid response, high precision and good reliability, and is widely used in various fields.
