The global Pig Farm Management Software market size is expected to reach \$ 704 million by 2032, rising at a market growth of 8.4% CAGR during the forecast period (2026-2032).

Pig farm management software is a digital management system designed specifically for pig farming enterprises or large-scale pig farms; it aims to utilize information technology to achieve precise, standardized, and intelligent management of the entire lifecycle of the pigs and their associated resources.

The growth of the pig farm management software market is primarily driven by the acceleration of large-scale farming, the need for stricter cost control, increasing pressure regarding disease prevention and control, and the digital transformation of the livestock industry. As large-scale pig farming enterprises and corporate farming groups continue to expand, traditional methods relying on manual record-keeping and experience-based management can no longer meet the demands for coordination across multiple sites, regions, and the entire production cycle. Consequently, there is a growing demand for integrated management functions covering areas such as breeding, herd batch management, precision feeding, health and disease prevention, environmental monitoring, inventory management, cost accounting, and business analysis. Meanwhile, factors such as fluctuating feed prices, rising labor costs, and cyclical changes in live pig prices have prompted farming enterprises to place greater emphasis on key performance indicators?including the feed conversion ratio, sow productivity, mortality rates, average daily gain, and unit production costs?thereby accelerating the widespread adoption of data-driven, precision management practices.
