The global Pigments for Poultry Feed market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Pigments for poultry feed are additives that are used to enhance the color of poultry products, such as egg yolks and chicken skin. The market for pigments in poultry feed is driven by the demand for high-quality, visually appealing poultry products.

There are different types of pigments used in poultry feed, including natural pigments derived from plant sources such as marigold, paprika, and turmeric, and synthetic pigments such as canthaxanthin and apo-ester. Natural pigments are preferred by some consumers due to their perceived health benefits, and are also used in organic poultry farming.

Pigments are added to the feed of poultry, particularly egg-laying hens and broiler chickens, to enhance the color of egg yolks and chicken skin. This can have a positive impact on the perception of the quality of the poultry products, and may result in higher prices and increased demand.

The market for pigments for poultry feed is expected to continue to grow in the coming years, driven by the increasing demand for high-quality and visually appealing poultry products. The use of natural pigments in poultry feed is expected to grow, particularly in the organic and free-range poultry farming sectors.
