According to our (Global Info Research) latest study, the global PLA 3D Printing Filament market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

PLA 3D printing filament is a common 3D printing material, which is made of polylactic acid (PLA). PLA is a biodegradable polymer, usually obtained by chemically converting plant-derived substances such as cornstarch or sucrose. PLA 3D printing filament is suitable for most desktop 3D printers because it is easy to use and process, and has a low melting point and high fluidity. It is an environmentally friendly material that does not produce toxic gases and has no noticeable odor during printing. The PLA 3D printing filament will melt during the printing process, and then build up layer by layer through the nozzle of the 3D printer to form the desired object. After printing, the PLA material will cool and solidify quickly, and keep its shape. PLA 3D printing filament is widely used in fields such as education, model making, prototyping and small batch production. It can print models with high precision and rich details, and it can be used to print objects of various colors and textures. In addition, the price of PLA printing filament is relatively low and easy to obtain, so it is very popular among users.
