According to our (Global Info Research) latest study, the global Plain Aluminum Foil for Air Conditioner Radiator market size was valued at US\$ 1644 million in 2025 and is forecast to a readjusted size of US\$ 2243 million by 2032 with a CAGR of 4.5% during review period.

Plain aluminum foil for air conditioner radiator refers to the basic aluminum foil material that has not been treated with hydrophilic, corrosion-resistant, or antibacterial surface functional coatings. It is mainly used in the manufacturing of air conditioner evaporator and condenser fins. Its substrate is usually made of aluminum alloys such as 1100, 1200, 3102, 8011, etc., which are rolled to form thin aluminum foil with a thickness of about 0.08 mm to 0.15 mm. The heat exchange function is achieved by relying on the good thermal conductivity, formability, and corrosion resistance of aluminum itself. Aluminum foil does not have the ability to quickly spread condensed water, so it is easy to form water droplets in the evaporator environment, resulting in increased air resistance and decreased local heat transfer efficiency. However, due to its simple processing technology and low cost, it still retains its application in some cost sensitive air conditioning products and condenser structures. In 2025, global Plain Aluminum Foil for Air Conditioner Radiator production reached approximately 542 K MT, with an average global market price of around US\$ 2,947 per MT. The annual production capacity of plain aluminum foil for air conditioner radiator is 800 K MT, with a gross profit margin of about 15%.

The upstream mainly consists of suppliers of electrolytic aluminum, aluminum ingots, and recycled aluminum, among which the cost of aluminum ingots directly determines the industry's profit fluctuations; Downstream, the focus is on manufacturers of

household air conditioners, commercial air conditioners, heat pumps, refrigeration equipment, and automotive air conditioning heat exchangers, with core customers including air conditioning host factories and heat exchanger assembly factories. In the cost structure, aluminum substrate costs account for the highest proportion, usually reaching 70% to 80%, coating materials account for about 5% to 10%, energy and manufacturing processing costs account for about 8% to 12%, and labor, packaging, and logistics costs account for about 5% to 8%.

Plain aluminum foil for air conditioner radiator is a traditional basic product in air conditioning heat exchange materials. Its current market share has decreased to about 15% to 22%, mainly concentrated in low-end household air conditioners, some export window units, and industrial condensing equipment fields. With the continuous improvement of global air conditioning energy efficiency standards, the continuous replacement of plain aluminum foil with hydrophilic aluminum foil has become a clear trend. However, due to the low production cost and mature manufacturing process of plain aluminum foil, it still has stable demand in emerging markets with fierce price competition. The core of industry competition still lies in cost control and thickness accuracy control of aluminum substrates. The overall profit level is lower than that of hydrophilic aluminum foil, and it belongs to a typical segmented market of 'bulk basic materials, low added value, and significantly affected by aluminum prices'.
