According to our (Global Info Research) latest study, the global Plane Holographic Grating market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

A plane holographic grating is an optical element used to disperse an incident light beam into different wavelengths or spectra. It is a structure with periodic refractive index changes fabricated on a planar surface that can disperse light through interference effects.

A plane holographic grating is usually made of transparent materials, and the surface is engraved with regular grooves or protrusions. The diffraction effect of different wavelengths of light on the grating causes them to spread out at different angles, forming a spectrum. Therefore, planar holographic gratings can be used to separate different wavelengths of light for spectral analysis and measurement.
