According to our (Global Info Research) latest study, the global Plant Extraction Centrifuge market size was valued at US\$ 364 million in 2024 and is forecast to a readjusted size of USD 479 million by 2031 with a CAGR of 4.0% during review period.

Plant extraction centrifuge is a device that uses a motor to drive the drum to rotate at high speed. Under the shear force generated by the rotation of the drum or blades, two materials with different densities and immiscible (usually plant extracts and solvents) are mixed and transferred, and then quickly separated under the centrifugal force generated by the high-speed rotation of the drum. Under the centrifugal force generated by the high-speed rotation of the drum, the liquid with higher density gradually moves away from the center of the drum and toward the drum wall, while the liquid with lower density gradually moves away from the drum wall and toward the center. Finally, the two phases of liquid are thrown into the collection chamber through their respective channels to complete the separation of the two phases.
