Plant soil remediator is a substance designed to improve soil quality, promote plant growth, and help repair soil pollution (such as heavy metals, organic matter, etc.). It acts on the soil through specific physical, chemical or biological mechanisms to achieve the purpose of improving soil fertility, improving soil structure, reducing the toxicity of pollutants or removing pollutants. Plant soil remediator improves the physical and chemical properties of the soil by increasing the content of soil organic matter and adjusting the pH of the soil, making the soil more loose and breathable, which is conducive to the growth and development of plant roots. Provide the nutrients and trace elements required for plant growth, enhance the photosynthesis and metabolic capacity of plants, and improve the resistance and yield of plants. Through biological mechanisms such as microbial degradation and plant absorption, as well as physical and chemical mechanisms such as chemical adsorption and precipitation, remove or reduce the content of pollutants in the soil and restore the normal function of the soil.
