Abstracts

According to our (Global Info Research) latest study, the global Plant Tenderizing Enzymes market size was valued at US\$ 289 million in 2025 and is forecast to a readjusted size of US\$ 398 million by 2032 with a CAGR of 4.1% during review period.

Plant tenderizing enzymes are proteolytic enzymes derived from plants or plant extracts that improve texture and tenderness by breaking down muscle proteins, collagen, and connective tissues. Key enzymes include papain, bromelain, and ficin, widely used in food processing and protein modification. In 2025, the global sales volume of plant tenderizing enzymes reached 11,200 tons, with an average price of approximately US\$25,100 per ton. Due to the relatively stable prices of upstream agricultural raw materials (such as papaya and pineapple) and the high degree of standardization in extraction processes, the industry's overall gross profit margin remained within a healthy range, approximately 30% to 55%. The upstream of the industry includes plant raw materials (papaya, pineapple, fig) and enzyme extraction technologies as well as microbial fermentation alternatives. Midstream consists of enzyme manufacturers responsible for extraction, purification, formulation, and stabilization, with key barriers in maintaining enzyme activity and industrial adaptability. Downstream applications are concentrated in food processing, including meat tenderization, plant protein processing, seafood processing, ready meals, and functional foods. Meat processing remains the dominant segment, while plant-based meat represents a fast-growing demand driver.
