According to our (Global Info Research) latest study, the global Plasma Cutting Torches market size was valued at USD 216.6 million in 2023 and is forecast to a readjusted size of USD 294.7 million by 2030 with a CAGR of 4.5% during review period.

Plasma cutting torches usually use a copper nozzle to constrict the gas stream with the arc flowing through it. That arc jumps from an electrode in the torch to something else – usually the conductive material being cut. That's a 'transferred arc'. There are some systems that use a 'non-transferred' arc where it jumps from the electrode back to the nozzle, but those are not usually used for cutting. So that means that plasma cutting is only used for materials that are conductive, primarily mild steel, stainless steel, and aluminum. But lots of other metals and alloys are conductive too, such as copper, brass, titanium, monel, inconel, cast iron, etc. The problem is that the melting temperature of some of those metals makes them difficult to cut with a good quality edge.

According to the Segmentation of types, all the market of Plasma Cutting Torches can be divided as follows: The first main kind is Low Frequency it hold a comparatively larger share in global market, which accounts for about 64% in 2019. Another main kind is High Frequency, High Frequency share the rest about 36% market share in 2019.
