## **Abstracts**

This report studies the Plasma Etch System market. Plasma Etching System is a series of devices and equipment used together to perform plasma etching.

Plasma etching is a form of plasma processing used to fabricate integrated circuits. It involves a high-speed stream of glow discharge (plasma) of an appropriate gas mixture being shot (in pulses) at a sample. The plasma source, known as etch species, can be either charged (ions) or neutral (atoms and radicals). During the process, the plasma generates volatile etch products at room temperature from the chemical reactions between the elements of the material etched and the reactive species generated by the plasma. Eventually the atoms of the shot element embed themselves at or just below the surface of the target, thus modifying the physical properties of the target.

According to our (Global Info Research) latest study, the global Plasma Etch System market size was valued at US\$ 7356 million in 2023 and is forecast to a readjusted size of USD 16330 million by 2030 with a CAGR of 12.2% during review period.
