Abstracts

The global Plasma Resectoscope market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Plasma resectoscopy is the most effective treatment for resection of prostate and bladder tumors. The biggest problem with conventional resectoscopes in the past was that it was easy to cause water intoxication in patients, and the hemostatic effect was poor. The surgeon was required to complete the operation within one hour. Compared with conventional resection of the prostate, bipolar plasma resection uses normal saline as irrigation fluid and adopts a dynamic plasma cutting mechanism.

This report studies the global Plasma Resectoscope production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Plasma Resectoscope, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year. This report explores demand trends and competition, as well as details the characteristics of Plasma Resectoscope that contribute to its increasing demand across many markets.
