## Abstracts

According to our (Global Info Research) latest study, the global Plastic Demineralized Bone Fiber market size was valued at USD 637.9 million in 2022 and is forecast to a readjusted size of USD 860.3 million by 2029 with a CAGR of 4.4% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Demineralized bone matrix (DBM) is a form of allograft using acidic solution to remove mineral components, while leaving much of the proteinaceous components native to bone, with small amounts of calcium-based solids, inorganic phosphates, and some trace cell debris. It is an osteoconductive and osteoinductive biomaterial and is approved as a medical device for use in bone defects and spinal fusion. To pack consistently into the defect sites and stay firmly in the filling parts, DBM products have various forms combined with biocompatible viscous carriers, including sponges, strips, injectable putty, paste, and paste infused with chips.

The most popular DBM product is a moldable bone paste or putty, which can be consistently packed into defect sites and remain firm. A moldable DBM product could be made of the composite of DBM powder/particles combined with biocompatible viscous carriers, which provides a stable suspension of DBM powder/particles. In general, according to their molecular weight, the viscous carriers could be divided into the following two classifications: (i) polymer materials, such as collagen, chitosan, hyaluronic acid (HA), carboxymethylcellulose (CMC), and poloxamer 407; and (ii) low molecular materials, such as glycerol, calcium sulfate, and bioactive glass .

The polymer carriers mainly include the natural polymer materials (e.g. chitosan, HA,

sodium alginate, CMC, and type I collagen) and synthetic polymer materials (e.g. poloxamer 407). They are all demonstrated to be biocompatible and biodegradable after implantation in vivo, and have attractive viscosity to cohere with DBM powder particles. The low molecular carriers mainly include glycerol, calcium sulfate, and bioactive glass. They all have good plasticity, could be arbitrarily shaped mixed with DBM, and could help with osteogenesis due to their unique characteristics.
